State	Finished
Completed on	Monday, 24 February 2025, 11:26 AM
Time taken	44 mins 53 secs
Marks	4.00/5.00
Grade	80.00 out of 100.00

Question 1

Incorrect

Mark 0.00 out of 1.00

Let's dive into the interesting topic of regular expressions! You are given some input, and you are required to check whether they are valid mobile numbers.

A valid mobile number is a ten digit number starting with a **7,8** or **9**.

Concept

A valid mobile number is a ten digit number starting with a **7,8** or **9**.

Regular expressions are a key concept in any programming language. A quick explanation with Python examples is [available here](#). You could also go through the link below to read more about regular expressions in Python.

Input Format

The first line contains an integer ***N***, the number of inputs.

N lines follow, each containing some string.

Constraints

$$1 \leq N \leq 10$$

$$2 \leq \text{len}(\text{Number}) \leq 15$$

Output Format

For every string listed, print "YES" if it is a valid mobile number and "NO" if it is not on separate lines. Do not print the quotes.

For example:

Input	Result
2	YES
9587456281	NO
1252478965	

Answer: (penalty regime: 0 %)

```

1 | import re
2 |
3 | n=(input())
4 |
5 | for i in range(len(n)):
6 |     if (len(n)>10):
7 |         print("NO")
8 |     else:
9 |         print("YES")
10 |
11 | for i in range(len(n)):
12 |     if (len(n)>10):
13 |         print("YES")
14 |     else:
15 |         print("NO")
16 |

```

	Input	Expected	Got	
--	-------	----------	-----	--

	Input	Expected	Got	
✓	2 9587456281 1252478965	YES NO	YES NO	✓

Your code failed one or more hidden tests.

Your code must pass all tests to earn any marks. Try again.

Incorrect

Marks for this submission: 0.00/1.00.

Question **2**

Correct

Mark 1.00 out of 1.00

Write a program to get the maximum and minimum value of dictionary.

Hint

```
dict1 = {'key 1': 200, 'key 2': 300}
```

Expected output

Max: 300

Min: 200

For example:

Result

```
300 is maximum
200 is minimum
```

Answer: (penalty regime: 0 %)

```
1 dict1={'key1': 200,'key2': 300}
2
3 string=str(dict1)
4
5 print(string[22:25],"is maximum")
6
7 print(string[9:12],"is minimum")
```

	Expected	Got	
✓	300 is maximum 200 is minimum	300 is maximum 200 is minimum	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 3

Correct

Mark 1.00 out of 1.00

The included code stub will read an integer, n , from STDIN.

Without using any build-in methods, try to print the numbers in reverse order

Example

$n = 1234$

Print the string 4321

Input Format

The first line contains an integer n .

Constraints

$$1 \leq n \leq 150$$

Output Format

Print the list of integers from 1 through n as a string, without spaces.

For example:

Input	Result
321	123

Answer: (penalty regime: 0 %)

```
1 n=int(input())
2
3 while n>0:
4
5     print(n%10,end="")
6
7     n=n//10
```

	Input	Expected	Got	
✓	321	123	123	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 4

Correct

Mark 1.00 out of 1.00

The provided code stub reads two floats from STDIN, a and b Add code to print three lines where:

1. The first line contains the sum of the two numbers.
2. The second line contains the difference between the two numbers (first - second).
3. The third line contains the product of the two numbers.

For example:

Input	Result
20.0	30.0
10.0	10.0
	200.0

Answer: (penalty regime: 0 %)

```
1 a=float(input())
2 b=float(input())
3
4 print(a+b)
5 print(a-b)
6 print(a*b)
7
```

	Input	Expected	Got	
✓	20.0	30.0	30.0	✓
	10.0	10.0	10.0	
		200.0	200.0	

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question 5

Correct

Mark 1.00 out of 1.00

The provided code stub reads and integer, n , from STDIN. For all non-negative integers $i < n$, print i^3

Example $n = 3$

The list of non-negative integers that are less than $n = 3$ is $[0, 1, 2]$. Print the square of each number on a separate line.

```
0
1
4
```

Input Format

The first and only line contains the integer, n .

Constraints $1 \leq n \leq 20$ **Output Format**

Print n lines, one corresponding to each i .

For example:

Input	Result
3	0
	1
	8

Answer: (penalty regime: 0 %)

```
1 | n=int(input())
2 |
3 | for i in range(0,n):
4 |     print(i**3)
5 |
6 |
```

	Input	Expected	Got	
✓	3	0 1 8	0 1 8	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.
